## INTRODUCTION

The intensity of erosion $\approx$
$f$ (rainfall erosivity, soil erodibility, morphology, \& land use)

Currently, the USLE applications cannot use for base assumptions, since the formula is no longer correct that causes wrong generalization

## USLE modification

Where

$k^{\prime}=C . M S$ atis zensant 0. IS fer high platicity rit and 1.07 for tigh platicity clay
 RK. SCP $=$ sial

$$
\mathrm{E}_{\mathrm{v}}=\mathrm{k}[\mathrm{RKLSCP}]
$$

Where $K=$ erosion coefficient of USLE; 0.51 for high plasticity clay (CH) and 0.77 for high plasticity silt (MH).

The $\mathbf{k}_{\text {M-c-s }}$ correction for various land uses

| Land use | CP | $\mathrm{k}_{\mathrm{M}-\mathrm{C} \text {-S }}$ |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  |  | CH | MH | ML | SM |
| Residential area | 0.60 | 0.41 | 0.62 | 0.64 | 0.26 |
| Mixture farming \& grove | 0.30 | 0.20 | 0.31 | 0.32 | 0.13 |
| Paddy field | 0.05 | 0.03 | 0.05 | 0.05 | 0.02 |
| Farming field | 0.75 | 0.51 | 0.77 | 0.80 | 0.33 |
| Plantation field | 0.40 | 0.27 | 0.41 | 0.43 | 0.18 |
| Forest | 0.03 | 0.02 | 0.03 | 0.03 | 0.01 |

## CONCLUSI ON

Residual soils originated from weathered Quaternary volcanic deposits in southern Bandung basin are highly plastic.

The result of validation of hypothesis using deterministic approach exhibits that ratio between fine-grained to coarsegrained soil fractions determines the soil erodibility.

## ACKNOWLEDGEMENT

The authors are grateful to Prof. Adjat Sudradjat, Prof. Emmy Suparka, Dr. IIdrem Syafri, Dr. Mega F. Rosana, and Dr. Lobo M. Balia for supporting this research. They also would like to thank Dr. Hendarmawan and Mr. Yuyun Yuniardi, MT on behalf of Faculty of Geological Sciences and Engineering, University of Padjadjaran, for financial support for the presentation of this paper.
