### Principles Microeconomics (Consumers)

$$\text{Max}_{Z,A,X} \quad U(Z, A, X; \alpha)$$

$$\text{s.t.} \quad P(Z, A) + X = Y$$

Solving

$$\phi(Z, A, Y, U; \alpha) \quad \text{W.T.P.}$$

Where: Z Structural characteristics, A surrounding attributes, Y home income level, X represent consumption of other goods and services,  $\alpha$  socioeconomic characteristics.

FIG Working Week

The Usage of Cadastral Information for the Formulation of Environmental Policies

### Principles Microeconomics (Firms)

$$\text{Max}_{Z,A,N} \quad \pi = NP(Z, A) - C(Z, A, N; \beta)$$

Solving

$$\rho(Z, A, N; \beta) \quad \text{W.T.A.}$$

Where:  $C(Z, A, N; \beta)$  Producer's cost function, N is quantity of produced units,  $\beta$  technology and price factors.

### Case Study

#### Methodology

- i) the sample was calculated and chose in a random way
- ii) inconsistent data were eliminated
- iii) tests of statistical validation were elaborated
- iv) using GIS to evaluate the consistency of the sample from the point of view of space
- v) econometric models were constructed and,
- vi) analysis of results was done

FIG Working Week

### Case of Atmospheric Pollution

#### Hypothesis

- Air pollution (by suspended particles), being a negative externality, leads to a loss of value in the houses of Bogotá
- As a logical consequence it produces a loss in welfare of society
- To prove this hypothesis and to estimate loses of welfare of society; we need several sources of information, primarily on cadastral information

FIG Working Week 

The Usage of Cadastral Information for the Formulation of Environmental Policies

### Case of Atmospheric Pollution

#### Model Econometric

Estimated econometric model using Box-Cox transformation

$$A_{\text{valuo}}^{(\theta)} = \beta_0 + \beta_1 \text{punti}^{(\lambda)} + \beta_2 \text{arte}^{(\lambda)} + \beta_3 \text{arco}^{(\lambda)} + \beta_4 \text{uso}^{(\lambda)} + \beta_5 \text{via}^{(\lambda)} + \beta_6 \text{dust}^{(\lambda)} + \beta_7 \text{agua}^{(\lambda)} + \beta_8 \text{parc}^{(\lambda)} + \beta_9 \text{estr}^{(\lambda)} + \varepsilon_i$$

FIG Working Week 

The Usage of Cadastral Information for the Formulation of Environmental Policies

### Case of Parks

#### Hypothesis

- Maintain and conserve park and public spaces has a positive impact on the welfare of society.
- Parks and spaces public near increasing to value of housing.
- To prove this hypothesis and to estimate benefits of welfare of society; we need several sources of information, primarily on cadastral information.

FIG Working Week 

The Usage of Cadastral Information for the Formulation of Environmental Policies

### Case of Parks

#### Model Econometric

Estimated econometric model using Box-Cox transformation

$$A_{\text{valuo}}^{(\theta)} = \beta_0 + \beta_1 \text{Ac}^{(\lambda)} + \beta_2 \text{Capto}^{(\lambda)} + \beta_3 \text{Th}^{(\lambda)} + \beta_4 \text{Npl}^{(\lambda)} + \beta_5 \text{EsB}^{(\lambda)} + \beta_6 \text{EsA}^{(\lambda)} + \beta_7 \text{EsB}^{(\lambda)} + \beta_8 \text{EsC}^{(\lambda)} + \beta_9 \text{Norte}^{(\lambda)} + \beta_{10} \text{Tip}^{(\lambda)} + \varepsilon_i$$

FIG Working Week 

The Usage of Cadastral Information for the Formulation of Environmental Policies

### Case of Parks

FIG Working Week 

The Usage of Cadastral Information for the Formulation of Environmental Policies

### Case of Soil Erosion

#### Hypothesis

- Inadequate use of soil promotes an increment in erosion rates. So has a negative impact on the welfare of society
- Erosion of soil decreasing to value of land
- To prove this hypothesis and to estimate losses of welfare of society; we need several sources of information, primarily on cadastral information

FIG Working Week  
The Usage of Cadastral Information for the Formulation of Environmental Policies

## Case of Soil Erosion

### Model Econometric

Estimated econometric model using autoregressive models SAR

$$\ln P = \alpha + \sum_{i=1}^n \beta_i Z_i + \rho W_p + \varepsilon$$

$$W_p = W * P$$

Where W is a matrix of weights constructed the inverse value of the distance between the centroids of lands

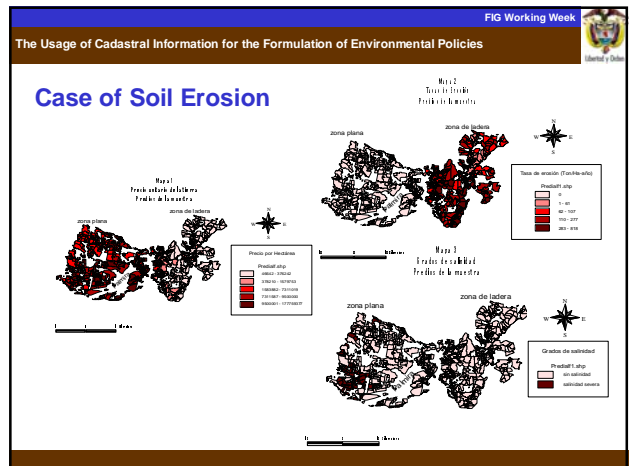

FIG Working Week  
The Usage of Cadastral Information for the Formulation of Environmental Policies

## Case Conclusions

- Pollution by particles represents a negative externality, which generates a loss of welfare in society. The importance is that the losses in welfare can be quantified in monetary units.
- The presence of urban parks in Bogotá influences in a positive way Bogotá's society because they are perceived as positive externalities, since they increase the value of housing.
- The importance is give the quantitative evidence (monetary) of losses of welfare on individuals. In the last case by cause of erosion, using for it the consumption of a private good like the property and based on hedonic models.

FIG Working Week  
The Usage of Cadastral Information for the Formulation of Environmental Policies

## General Conclusions

- The cadastral information and the modern Land Information Systems developed by the cadastral authorities in Colombia must serve the academic community constructs development models as well as local and national authorities use them for the formulation of environmental and social policies.
- Spatial Econometrics is contributing to tests and spatial models every time with greater capacity of prediction and would be important that the cadastral authorities modernize their methodologies
- Finally, it is important study the economic valuation, especially of nonmarketable goods (environmental goods) because only of this form the public administration can calculate the social's profits or costs that the implementation of any public policy and estimate the impact that this can have in the welfare of society.
