Integrating 3D data acquisition techniques for comprehensive study of the ancient Hellenistic-Roman Theatre of Paphos, Cyprus

Geom. Paola Ronzino

Topographical and photogrammetric survey of Paphos Theatre

Aim of the project:

Create a 3D model of the Hellenistic-Roman Theatre of Paphos

Technologies adopted:

- Automatic photogrammetry (Fly Scan)
- Laser scanning

Outcome:

3D model suitable for:

- Documentation
- Dissemination
- Virtual reconstruction
- Sections and maps extraction
- Visualization: Internet, standard monitors, special 3D visualization monitors.

Conclusions

The integration of the two techniques is suggested in order to achieve a complete and accurate documentation of the studied object:

- aerial photogrammetry for large scale acquisition with accuracy of 1-2 cm
- laser scanning for the acquisition of fine details with accuracy of 1 mm.

The research goal of a work and the expected results are in sum the **key factors** in the choice of the technology to adopt.
