"Geospatial Information for a Smarter Life and Environmental Resilience"

## 1. The method of determining the marine gravity anomalies from the satellite altimeter data

### 1.1. How altimetry works

$$h = c \frac{\Delta t}{2} \quad (1)$$

$$SSH = H - h - h_{cor} \quad (2)$$

$h_{cor}$  – Corrections

$H$  – Satellite height above ellipsoid

Fig. 1. Principle of altimetry

# FIG WORKING WEEK 2019

22–26 April, Hanoi, Vietnam

"Geospatial Information for a Smarter Life and Environmental Resilience"

## The components of sea surface height

$$SSH = N_{EGM} + \Delta N + h_{MDT} + h_t \quad (3)$$

$N_{EGM}$  – the long-wavelength geoid height

$\Delta N$  – the residual geoid height

$h_{MDT}$  – the mean dynamic topography

$h_t$  - the time-varying sea surface topography

# FIG WORKING WEEK 2019

22-26 April, Hanoi, Vietnam

"Geospatial Information for a Smarter Life and Environmental Resilience"

$$SSH = N_{EGM} + \Delta N + h_{MDT} + h_t \quad (3)$$

**For determination gravity anomaly from sea surface height, We need to remove**

- the long-wavelength geoid height
- the mean dynamic topography
- the time-varying sea surface topography

and use **the residual geoid height**

to determine **residual gravity anomalies**  $\Delta g_{res}$

## 2. The results of determining the gravity anomalies in the sea of the TruongSa's Archipelago from the Cryosat-2 data

- study area (latitude: from  $6^{\circ}30'$  to  $12^{\circ}00'$ ; longitude: from  $112^{\circ}00'$  to  $117^{\circ}30'$ ) ( $\approx 366.000 \text{ km}^2$ )
- Cryosat-2 satellite altimeter data
  - 52 cycles, 72.483 observations
  - observed from 04 - October, 2012 to 15 - September, 2016
- global Geopotential model (EGM2008)
- The global mean dynamic topography (DTU13MDT)

"Geospatial Information for a Smarter Life and Environmental Resilience"

## Accuracy assessment of the results by comparing with a ship-measured gravity points

We compared the results with the gravity of 625 points measured on a ship

The comparison statistics are as follows:

- The maximum deviation: +1.30 mGal
- The minimum deviation: -1.82 mGal
- The average deviation: +0.03 mGal
- The Standard deviation:  $\pm 0.67$  mGal

# FIG WORKING WEEK 2019

22–26 April, Hanoi, Vietnam

"Geospatial Information for a Smarter Life and Environmental Resilience"

- The comparison shows that the satellite-derived gravity anomalies **match well** with the ship-measured gravity with very small deviations.

**Fig. 7. The frequency of occurrence of the deviation**

"Geospatial Information for a Smarter Life and Environmental Resilience"

## CONCLUSION

- The marine gravity anomalies can be determined from the satellite altimeter data under the process as shown in this paper.
- The satellite-derived gravity anomalies on the sea of the Truong Sa's Archipelago match well with the ship-measured gravity.
